

SWEEP STOP INSTALLATION INSTRUCTIONS

REDUCTION WHEEL

The sweep stop is intended to stop the bin sweep near the door so that it is conveniently located for the next use. The sweep stop **IS NOT** intended as a device to allow persons to enter the bin while the unit is in operation. The sweep should always be turned off and locked out before entering the bin!

There are 2 styles of sweep stops which both function the same. The sweep stop should be located just to the left (Counterclockwise) of the door with the mounting plate set up 11-5/8" from the floor. Use 3 bolts to attach the sweep stop to the bin wall. Install the spring between the two small holes as shown and check to insure that the stop springs back out after folding in. If the stop doesn't function properly please contact your dealer and resolve any problems before putting the sweep into service.
